High-order discretization of PDE-constrained optimization

- *Continuous* PDE-constrained optimization problem

$$\underset{\boldsymbol{U}, \boldsymbol{\mu}}{\text{minimize}} \quad \mathcal{J}(\boldsymbol{U}, \boldsymbol{\mu})$$

$$\text{subject to} \quad \boldsymbol{C}(\boldsymbol{U}, \boldsymbol{\mu}) \leq 0$$

$$\frac{\partial \boldsymbol{U}}{\partial t} + \nabla \cdot \boldsymbol{F}(\boldsymbol{U}, \nabla \boldsymbol{U}) = 0 \quad \text{in } v(\boldsymbol{\mu}, t)$$

- *Fully discrete* PDE-constrained optimization problem

$$\begin{array}{ll} \underset{\boldsymbol{u}_0, \dots, \boldsymbol{u}_{N_t} \in \mathbb{R}^{N_u},}{\text{minimize}} & J(\boldsymbol{u}_0, \dots, \boldsymbol{u}_{N_t}, \boldsymbol{k}_{1,1}, \dots, \boldsymbol{k}_{N_t,s}, \boldsymbol{\mu}) \\ & \boldsymbol{k}_{1,1}, \dots, \boldsymbol{k}_{N_t,s} \in \mathbb{R}^{N_u}, \\ & \boldsymbol{\mu} \in \mathbb{R}^{n_\mu} \end{array}$$

$$\text{subject to} \quad \boldsymbol{C}(\boldsymbol{u}_0, \dots, \boldsymbol{u}_{N_t}, \boldsymbol{k}_{1,1}, \dots, \boldsymbol{k}_{N_t,s}, \boldsymbol{\mu}) \leq 0$$

$$\boldsymbol{u}_0 - \boldsymbol{g}(\boldsymbol{\mu}) = 0$$

$$\boldsymbol{u}_n - \boldsymbol{u}_{n-1} - \sum_{i=1}^s b_i \boldsymbol{k}_{n,i} = 0$$

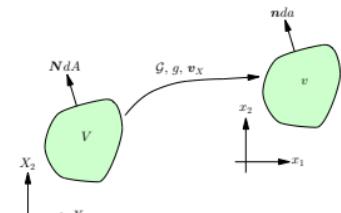

$$\boldsymbol{M} \boldsymbol{k}_{n,i} - \Delta t_n \boldsymbol{r}(\boldsymbol{u}_{n,i}, \boldsymbol{\mu}, t_{n,i}) = 0$$

Highlights of globally high-order discretization

- **Arbitrary Lagrangian-Eulerian formulation:**
Map, $\mathcal{G}(\cdot, \mu, t)$, from physical $v(\mu, t)$ to reference V

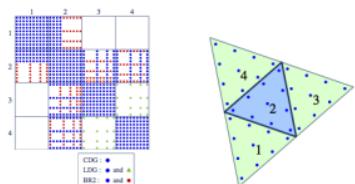

$$\frac{\partial \mathbf{U}_X}{\partial t} \Big|_X + \nabla_X \cdot \mathbf{F}_X(\mathbf{U}_X, \nabla_X \mathbf{U}_X) = 0$$

Mapping-Based ALE

- **Space discretization:** discontinuous Galerkin

$$M \frac{\partial \mathbf{u}}{\partial t} = \mathbf{r}(\mathbf{u}, \mu, t)$$

DG Discretization

$$\mathbf{u}_n = \mathbf{u}_{n-1} + \sum_{i=1}^s b_i \mathbf{k}_{n,i}$$

$$M \mathbf{k}_{n,i} = \Delta t_n \mathbf{r}(\mathbf{u}_{n,i}, \mu, t_{n,i})$$

- **Quantity of interest:** solver-consistency

$$F(\mathbf{u}_0, \dots, \mathbf{u}_{N_t}, \mathbf{k}_{1,1}, \dots, \mathbf{k}_{N_t,s})$$

Butcher Tableau for DIRK

Adjoint method to efficiently compute gradients of QoI

- Consider the *fully discrete* output functional $F(\mathbf{u}_n, \mathbf{k}_{n,i}, \boldsymbol{\mu})$
 - Represents either the **objective** function or a **constraint**
- The *total derivative* with respect to the parameters $\boldsymbol{\mu}$, required in the context of gradient-based optimization, takes the form

$$\frac{dF}{d\boldsymbol{\mu}} = \frac{\partial F}{\partial \boldsymbol{\mu}} + \sum_{n=0}^{N_t} \frac{\partial F}{\partial \mathbf{u}_n} \frac{\partial \mathbf{u}_n}{\partial \boldsymbol{\mu}} + \sum_{n=1}^{N_t} \sum_{i=1}^s \frac{\partial F}{\partial \mathbf{k}_{n,i}} \frac{\partial \mathbf{k}_{n,i}}{\partial \boldsymbol{\mu}}$$

- The sensitivities, $\frac{\partial \mathbf{u}_n}{\partial \boldsymbol{\mu}}$ and $\frac{\partial \mathbf{k}_{n,i}}{\partial \boldsymbol{\mu}}$, are expensive to compute, requiring the solution of $n_\boldsymbol{\mu}$ linear evolution equations
- **Adjoint method:** alternative method for computing $\frac{dF}{d\boldsymbol{\mu}}$ that require one linear evolution equation for each quantity of interest, F

Adjoint equation derivation: outline

- Define **auxiliary** PDE-constrained optimization problem

$$\underset{\substack{\boldsymbol{u}_0, \dots, \boldsymbol{u}_{N_t} \in \mathbb{R}^{N_u}, \\ \boldsymbol{k}_{1,1}, \dots, \boldsymbol{k}_{N_t,s} \in \mathbb{R}^{N_u}}}{\text{minimize}} \quad F(\boldsymbol{u}_0, \dots, \boldsymbol{u}_{N_t}, \boldsymbol{k}_{1,1}, \dots, \boldsymbol{k}_{N_t,s}, \boldsymbol{\mu})$$

subject to $\boldsymbol{R}_0 = \boldsymbol{u}_0 - \boldsymbol{g}(\boldsymbol{\mu}) = 0$

$$\boldsymbol{R}_n = \boldsymbol{u}_n - \boldsymbol{u}_{n-1} - \sum_{i=1}^s b_i \boldsymbol{k}_{n,i} = 0$$

$$\boldsymbol{R}_{n,i} = \boldsymbol{M} \boldsymbol{k}_{n,i} - \Delta t_n \boldsymbol{r}(\boldsymbol{u}_{n,i}, \boldsymbol{\mu}, t_{n,i}) = 0$$

- Define **Lagrangian**

$$\mathcal{L}(\boldsymbol{u}_n, \boldsymbol{k}_{n,i}, \boldsymbol{\lambda}_n, \boldsymbol{\kappa}_{n,i}) = F - \boldsymbol{\lambda}_n^T \boldsymbol{R}_0 - \sum_{n=1}^{N_t} \boldsymbol{\lambda}_n^T \boldsymbol{R}_n - \sum_{n=1}^{N_t} \sum_{i=1}^s \boldsymbol{\kappa}_{n,i}^T \boldsymbol{R}_{n,i}$$

- The solution of the optimization problem is given by the **Karush-Kuhn-Tucker (KKT) system**

$$\frac{\partial \mathcal{L}}{\partial \boldsymbol{u}_n} = 0, \quad \frac{\partial \mathcal{L}}{\partial \boldsymbol{k}_{n,i}} = 0, \quad \frac{\partial \mathcal{L}}{\partial \boldsymbol{\lambda}_n} = 0, \quad \frac{\partial \mathcal{L}}{\partial \boldsymbol{\kappa}_{n,i}} = 0$$

Dissection of fully discrete adjoint equations

- **Linear** evolution equations solved **backward** in time
- **Primal** state/stage, $\mathbf{u}_{n,i}$ required at each state/stage of dual problem
- Heavily dependent on **chosen output**

$$\boldsymbol{\lambda}_{N_t} = \frac{\partial \mathbf{F}}{\partial \mathbf{u}_{N_t}}^T$$

$$\boldsymbol{\lambda}_{n-1} = \boldsymbol{\lambda}_n + \frac{\partial \mathbf{F}}{\partial \mathbf{u}_{n-1}}^T + \sum_{i=1}^s \Delta t_n \frac{\partial \mathbf{r}}{\partial \mathbf{u}} (\mathbf{u}_{n,i}, \boldsymbol{\mu}, t_{n-1} + c_i \Delta t_n)^T \boldsymbol{\kappa}_{n,i}$$

$$\mathbf{M}^T \boldsymbol{\kappa}_{n,i} = \frac{\partial \mathbf{F}}{\partial \mathbf{u}_{N_t}}^T + b_i \boldsymbol{\lambda}_n + \sum_{j=i}^s a_{ji} \Delta t_n \frac{\partial \mathbf{r}}{\partial \mathbf{u}} (\mathbf{u}_{n,j}, \boldsymbol{\mu}, t_{n-1} + c_j \Delta t_n)^T \boldsymbol{\kappa}_{n,j}$$

- Gradient reconstruction via dual variables

$$\frac{dF}{d\boldsymbol{\mu}} = \frac{\partial F}{\partial \boldsymbol{\mu}} + \boldsymbol{\lambda}_0^T \frac{\partial \mathbf{g}}{\partial \boldsymbol{\mu}}(\boldsymbol{\mu}) + \sum_{n=1}^{N_t} \Delta t_n \sum_{i=1}^s \boldsymbol{\kappa}_{n,i}^T \frac{\partial \mathbf{r}}{\partial \boldsymbol{\mu}}(\mathbf{u}_{n,i}, \boldsymbol{\mu}, t_{n,i})$$
